#### Construction Specification

1. Length - minimum of 50' (50' for single residence lot).
2. Width - 10' minimum, should be flared at the existing road; provide a minimum 12" radius.
3. Geotextile fabric (filter cloth) shall be placed over the existing ground, prior to placing stone. The plan approval authority may not require single family residences to use geotextile.
4. Stone - crushed aggregate (2" to 3") or reclaimed or recycled concrete equivalent shall be placed at least 6" deep over the length and width of the entrance.
5. Surface Water - all surface water flowing to or from the construction entrances shall be piped through the entrance, maintaining a positive drainage. Pipe installed through the stabilized construction entrance shall be protected with a mountable berm with 5:1 slopes and a minimum of 6" of stone over the pipe. Pipe has to be sized according to the drainage. When the SCE is located at a high spot and has no drainage to convey a pipe will not be necessary. Pipe shall be sized according to the amount of runoff to be conveyed. A 6" minimum will be required.
6. Location - A stabilized construction entrance shall be located at every point where construction traffic enters or leaves a construction site. Vehicles leaving the site must travel over the entire length of the stabilized construction entrance.

Fabric shall be fastened securely to each fence post with wire ties at top and mid-section and shall meet the following requirements (Class F):

Strength 50 lbs/in (min) Test: MSMT 504  
 Modulus 20 lbs/in (min) Test: MSMT 504  
 Rate 0.5 gal ft / minute (max) Test: MSMT 522  
 Efficiency 75% (min) Test: MSMT 522

Edges of geotextile fabric come together, they shall be overlapped, stapled to prevent sediment bypass.

Fabric shall be inspected after each rainfall event and maintained when air or when sediment accumulation reached 50% of the fabric height.

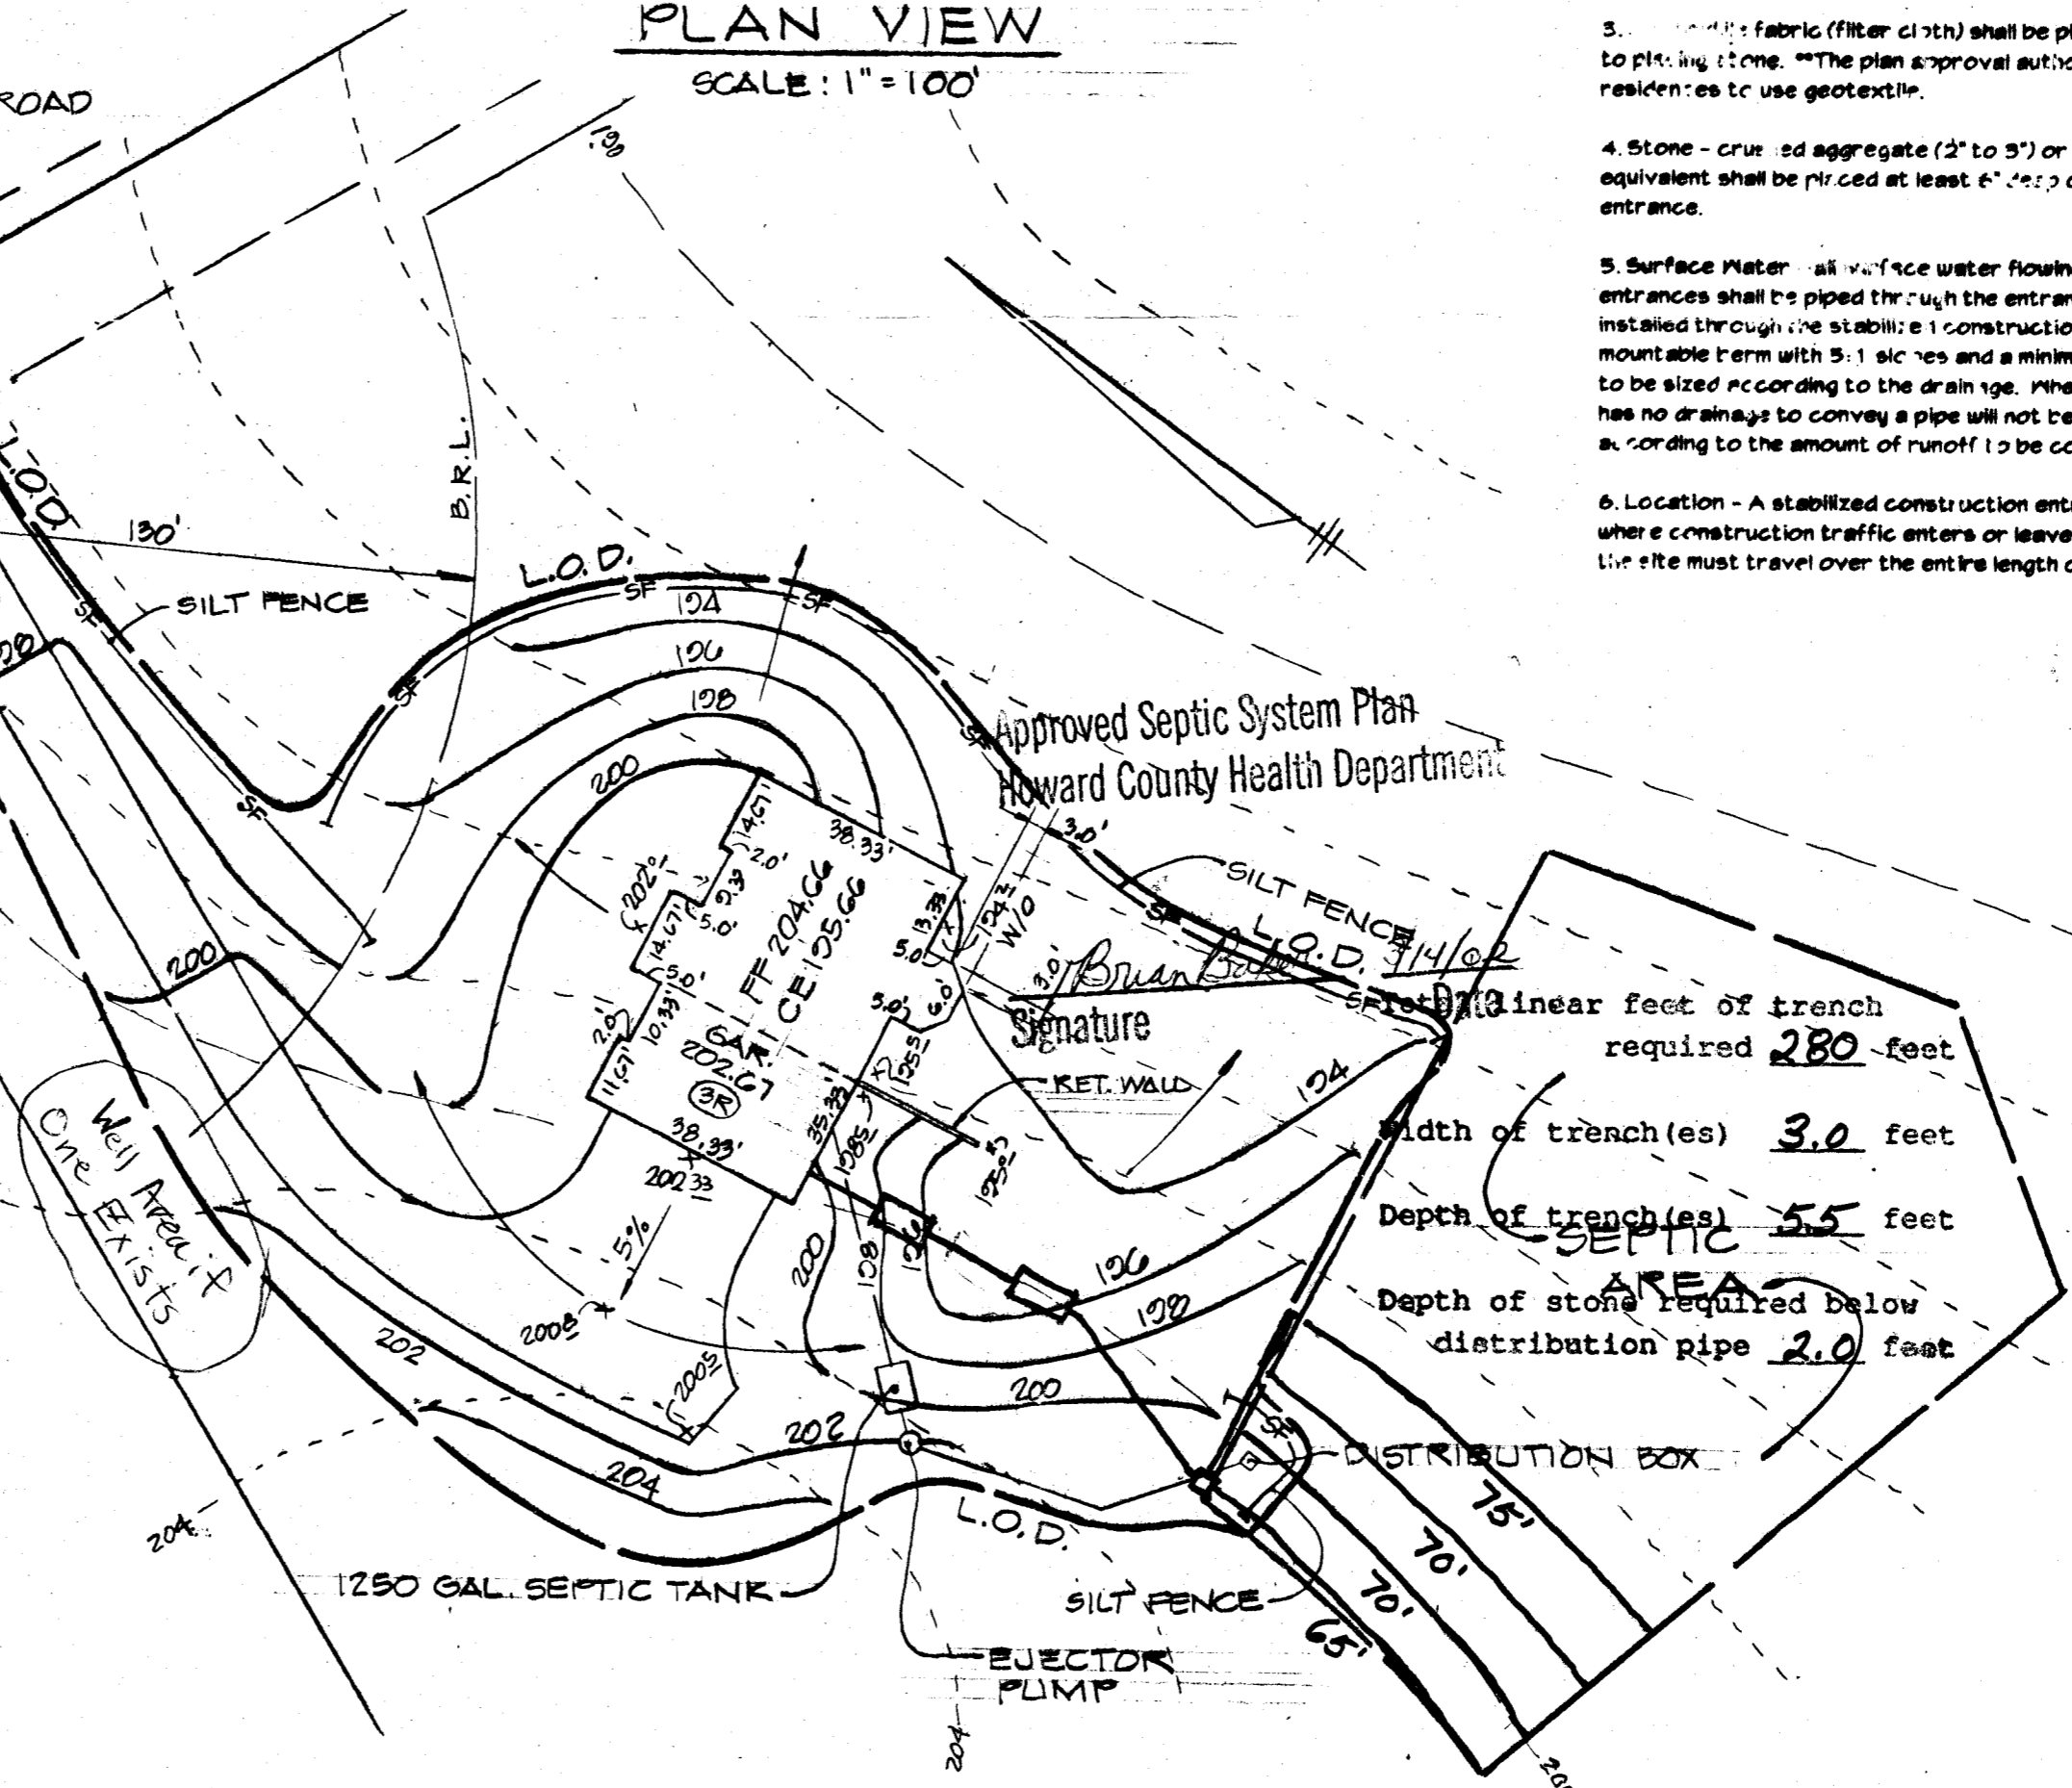

#### Silt Fence Design Criteria

Steepest	(Maximum) Slope Length	(Maximum) Silt Fence Length
greater than 50:1	unlimited	unlimited
