Number of Bedrooms 3

Septic Tank Capacity 1500 Gallons - Top Seamed and Two Chambered

Pump Chamber 1000 Gallons, Top Seamed

Sand Mound to be installed as per previously approved (06/17/93) Design Plans and Specifications (as drawn by Jim Clise).

- Stake out initial sand mound site and call for field varification by local health dept.
- Rope off reserve sewage disposal area during entire construction phase.
- Provide a copy of recent seive analysis of sand mound sand for health department approval.
- 48 hours notice required prior to construction of sand mound.
- Any deviation from the approved plans must be verified and approved by this department prior to implimentation.

PLANS APROVED BY Ronald J. Pinkley DATE 04/13/95

COVER NO WORK UNTIL INSPECTED AND APPROVED

NEITHER THE HOWARD COUNTY COUNCIL NOR THE HEALTH DEPARTMENT IS RESPONSIBLE FOR THE SUCCESSFUL OPERATION OF ANY SYSTEM

NOTE: CLEANOUT REQUIRED EVERY 70 FEET OF SEWER LINE AND/OR AT 90° SWEEPS IN LINES FROM HOUSE TO DRAIN FIELDS, 90° ELBOWS NOT ACCEPTABLE.

NOTE: ALL PARTS OF SEPTIC SYSTEMS (I.E. TANK, DISTRIBUTION BOX TRENCHES) TO BE 100 FEET FROM WELL (UNLESS OTHERWISE SPECIFICALLY AUTHORIZED)

NOTE: IF DEEP TRENCH(ES) ARE USED CALL FOR INSPECTION BEFORE AND AFTER PLACING GRAVEL IN TRENCH(ES)

NOTE: NO DRY WELL SHALL EXCEED 15 FOOT IN DIAMETER NO ABSORPTION TRENCH TO EXCEED 100 FEET IN LENGTH

NOTE: ALL PIPE FROM HOUSE TO SEPTIC TANK MUST BE CAST IRON OR SCHEDULE 35/40 PVC OR ABS

PERMIT VOID AFTER TWO YEARS

NOTE: INSTALL STAND PIPE ON SEPTIC TANK AND DRY WELL STAND PIPES MUST BE 6 INCHES IN DIAMETER CAST IRON. CONCRETE OR TERRA COTTA OR PVA OR ABS ACCEPTED. IF TOP OF SEPTIC TANK IS DEEPER THAN 3 FEET. MANHOLE TO GRADE REQUIRED.

NOTE: DISTRIBUTION BOXES MUST HAVE BAFFLES

***INSTALLER IS RESPONSIBLE FOR OBTAINING FINAL APPROVAL ON THIS PERMIT**

RE: PERCOLATION TEST RESULTS
APPLICATION # A-48395
Lot 2, Penn Shop Road

Dear Mr. Jefferson:

Percolation testing conducted August 19, 1992 on the above referenced property indicated limited satisfactory soil conditions. Two of the test holes were judged passed; all other test locations failed due to excessively rock content and faster than acceptable percolation rates. Copies of the test results are enclosed.

Landscape position was also a factor which hampered the prospects for approval. The most promising soils were located at the head of a swale which drains toward the current water supply for the existing farmhouse on the property.

It is the preliminary judgement of this office that this area failed the percolation test because a sewage disposal easement of sufficient size could not be established. Should a review of this decision be requested, such review is contingent upon submission of a scaled percolation certification plat showing actual locations and elevations of all excavated test holes and a suitable house and well site. The plat should also include the topography of the area under consideration and the location of the existing well.

This should be submitted within sixty (60) days to allow field verification if necessary. As discussed in the field, it is suggested that other areas on the property be considered for testing. This would seem to carry a greater prospect for approval and could be continued under authorization of this same test application.

RE: Perc Letter (A-48395)
off Penn Shop Road, Tested 8/19/92

You may recall we had discussed alternative systems, such as low pressure dosing, elevated bed, and sand mounds, as a possible solution should there prove to be insufficient area suitable for conventional sewage disposal systems.

According to the USDA Soil Survey for Howard County, approximately 25% of the 194 plus acres for this property are unsuitable prospects because of seasonally high water tables and/or close association to seasonal or perennial streams. Less than 2% of the parcel is mapped as Glenelg soil (the best candidate for a conventional system). The remaining approximately 73% of the soils mapped for this property are Mt. Airy and Linganore series which are rated severe, primarily due to shallow depth (i.e. less than 7 ft.) of soil to rock.

Simply put, while testing other sites on this property for conventional systems would be the recommended procedure to follow, please bear in mind that there is a fair to good probability that other sites may be no more suitable for conventional septic systems than the one just tested. In such an eventuality, you may wish to consider specialized testing for use of one of these alternative systems in lieu of further conventional site testing.

If you have any questions regarding such systems or additional testing procedures necessary to evaluate a site for such a system, please feel free to call me at 313-2640.

1. Design Criteria

3 Bedroom House
Design Flow - 450 GPD
1 - 1500 Gal. Compartmented Septic Tank (Top-Seam)
1 - 1,000 Gal. Pump Chamber (Top-Seam)
92 Gal. Dose @ 60 GPM
Bed Area - 9' x 42' = 378 Sq. Ft.
OK Mound Area - 34'-2" x 69'-4" = 2368 Sq. Ft.
TDH - 15'

2. Sewage Treatment

One 1500 gallon compartmented top-seam septic tank is to be installed in series with a 1,000 gallon top-seam pump chamber. The pump chamber is to provide 20" depth for pump elevation and submergence, 3-3/4" for the pump cycle dose, and 6" for the high water alarm. The additional capacity of the pump chamber will provide one (1) day's flow of emergency storage above the high water alarm.

The above capacities, measurements, and tank elevations shown on the drawing are based upon measurements of top-seam septic tanks and pump chambers as manufactured by Mayer Bros., Inc., Elkridge, MD (301) 795-1434.

3. A quick disconnect union and gate valve are to be provided on the pump discharge line as shown on the drawing.

4. Pressure piping from the pump chamber and the manifold are to be 3" Schedule 40 PVC.

5. Distribution laterals are to be 1" Schedule 40 PVC.

6. The pressure supply line, from the pumping station to the absorption bed, is to be installed with a continuous slope back to the pumping station to assure complete drainage of the effluent from the supply line following each pump cycle.

7. A submersible pump to remove 60 gpm against 15' TDH is to be provided. The pump should be a Goulds Model WE 0311 L, 1/3 hp, 115 volts, single phase, or equal. The pump control box is to be located above ground in a weatherproof enclosure.

8. The high water level sounding alarm is to be on a separate electrical circuit. The alarm is to be located inside the house.

9. Sand is to have an effective size between 0.25 and 0.50 mm with a uniformity coefficient no greater than 3.5 A list of suppliers of approved sand is available upon request from the Division of Residential Sanitation, MD Department of the Environment.

10. Gravel for the bed is to be 3/4" to 2" in diameter, washed and free of fines. Gravel is to be inspected and approved prior to placement. Following covering of the laterals with gravel, a layer of geotextile fabric is to be applied. Crushed limestone is not an acceptable substitute for gravel.

11. A test of the pumping system and distribution piping is required prior to covering the system.

12. Each 1" lateral is to be 19'-6" long with six (6) perforations 5/16 inch in diameter spaced 42" apart. A turn-up, as shown on the drawing, is to be provided on the extreme end of the lateral farthest from the pump. The other laterals are to terminate with an end cap, perforated as shown on the drawing.

13. The attached construction procedures as prepared by the Individual Septics & Wells Program, Department of the Environment, are included as a part of these specifications.

12. Each 1" lateral is to be 19'-6" long with six (6) perforations 5/16 inch in diameter spaced 42" apart. A turn-up, as shown on the drawing, is to be provided on the extreme end of the lateral farthest from the pump. The other laterals are to terminate with an end cap, perforated as shown on the drawing.

13. The attached construction procedures as prepared by the Individual Septics & Wells Program, Department of the Environment, are included as a part of these specifications.

SECTION FIVE

CONSTRUCTION PROCEDURES

5.1. GENERAL

Proper construction is extremely important if the sand mound is to function as designed. Installation of a sand mound system is prohibited when soils are frozen. Construction of the mound should not occur if the soil is too wet. Compaction and puddling of the soil in the location of the mound and downslope should be avoided. Soil is too wet for construction of the mound if a sample, taken anywhere within the upper eight inches, when rolled between the hands forms a wire. If the sample crumbles, the soil is dry enough for construction to proceed.

5.2. EQUIPMENT

The following special equipment is recommended:

1. A small track-type tractor with blade for placing and spreading the sand fill.
2. A cordless drill for drilling holes in the pipe on-site.
3. A moldboard or chisel plow for plowing the soil within the perimeter of the mound. A rototiller may be used on structureless soils with USDA sand textures.
4. A rod and level for determining bed elevations, slope on pipes, outlet elevation of septic tank, slope of site, etc.

5.3. MATERIALS

The following specifications are required:

1. Sand fill material must be approved by the local Approving Authority prior to hauling to the site. Submit a sample to the local Authority for analyses at least three weeks in advance of construction or select a sand fill from the list of potential sand suppliers. If a sample is submitted for analyses a fee will be charged. Sand fill shall have an effective size between 0.25 mm and 0.5 mm with a uniformity coefficient of 3.5 or less. A copy of the receipt from the sand supplier showing the company name, address, phone number, date and product name will be required.
2. Aggregate shall be clean aggregate free of fines and between 3/4 to 2 inches in diameter.
3. Geotextile fabric shall be of a type approved by the Approving Authority.
4. Cap material shall be soil relatively free of coarse fragments and preferably a clay loam or silt loam texture.

5.4. TANK INSTALLATION AND SITE PREPARATION

5.4.1 Locate and rope-off the entire sewage disposal area to prevent damage to the area during other construction activity on the site. Vehicular traffic over the disposal area should be prohibited to avoid soil compaction.

5.4.2 Install septic tank(s) and pumping chamber(s) and pump as shown on the drawings. Call for inspection.

5.4.3 Stake out the initial and recovery mound perimeters in their proper orientation as shown in the drawings. Reference stakes offset from the mound corner stakes are recommended. Locate the upslope edge of the absorption bed within the mound and determine the ground elevation at the highest location. Reference this elevation to a benchmark for future use. This is necessary to determine the bottom elevation of the absorption bed.

5.4.4 Excess vegetation should be cut and removed. Trees should be cut at ground level and stumps left in place.

5.4.5 Determine the location where the force main from the pumping chamber will connect to the distribution network manifold within the mound.

5.4.6 Install the force main from the pumping chamber to the proper location within the mound. Pipe should be laid with uniform slope back to the chamber so that it drains after dosing. Cut and stub off pipe one foot below existing grade within the proposed perimeter of the initial mound. Backfill trench and compact to prevent seepage along the trench.

5.4.7 Plow the soil within the perimeter of the mound to a depth of about eight inches, if the soil is not too wet. Moldboard or chisel plows may be used. Plowing should be done along the contour, throwing soil upslope. Use a two bottom or larger Moldboard plow. In wooded areas with stumps, roughening the surface to a depth of four to six inches with backhoe teeth may be satisfactory. However, all work should be done from the upslope or sides of the mound if at all possible. Rototilling may be used on soils with USDA textures of sand. After plowing, all foot and vehicular traffic shall be kept off the plowed area.

5.5. FILL PLACEMENT

5.5.1 Relocate and extend the force main several feet above the ground surface.

5.5.2 Place the approved sand fill material on the upslope edge(s) of the plowed area. Keep delivery trucks off the plowed area. Minimize traffic on the downslope side. Fill should be placed and spread immediately after plowing. Move the fill

material into place using a small track-type tractor with a blade. Work from the end and upslope side. Always keep a minimum of six inches of material beneath the tracks of the tractor to minimize compaction of the natural soil. The fill material should be worked in this manner until the height of the fill reaches the elevation of the top of the absorption bed.

5.5.3 With the blade of the tractor, form the absorption bed. Hand level the bottom of the bed and check it for proper elevation. The bed should be level for proper functioning of the mound. Call for inspection.

5.5.4 Shape the sides of the sand fill to design slope (ie., 3:1 or flatter).

5.6. BED AND DISTRIBUTION NETWORK

5.6.1 Carefully place the coarse aggregate in the bed. Do not create ruts in the bottom of the bed. Level the aggregate to a minimum depth of six inches.

5.6.2 The distribution network is assembled in place setting the manifold to ensure draining the laterals between doses. The laterals should be laid level with the holes directed downward. Call for inspection. Test the pumping chamber and distribution network with clean water.

5.6.3 Place additional aggregate to a depth of at least two inches over the crown of the pipe.

5.6.4 Place the approved geotextile fabric over the aggregate bed. The fabric may extend beyond the bed over the sand fill.

5.7. COVER MATERIAL

5.7.1 Place a finer textured soil material such as sandy clay loam, clay loam, or silt loam on top of the fabric over the bed. The minimum depth of this cap shall be six inches at the outer edges of the bed and 12 inches along the center.

5.7.2 Place a minimum of six inches of good quality topsoil over the entire mound surface including the sideslopes. Call for final inspection.

5.8. VEGETATION

5.8.1 Fertilize, lime, seed and mulch the entire surface of the mound. Grass mixtures adapted to the area should be used.

5.8.2 Consult the county extension agent or Soil Conservation Service for recommendations.

Mt Airy MD

TABLE 3.1

EQUATIONS FOR CALCULATING SAND MOUND DIMENSIONS

Absorption bed ft.² (A × B) = $\frac{\text{Design flow}}{1.2 \text{ gpd/ft.}^2}$ = 375 ft.² (450 gpd) 5% Slope

Bed length (B) = 42 ft. (21 ft. to 101 ft. dependent on site)

Bed width (A) = $\frac{\text{Bed } 375 \text{ ft.}^2}{\text{B } 42 \text{ ft.}}$ = 9 ft. (15 ft. or less)

Upslope sand fill depth (D) = 48 in. − Z in. = 24 in. (12 in. min.)

Downslope sand fill depth (E) = [12 A × % slope] + D in. = 29.4 in. (.05, 5.4 + 24)

Cap + topsoil at bed center (H) = 18 in.

Cap + topsoil at bed edge (G) = 12 in.

Total Bed Depth (F) = 10 in.

Sideslope setback (K) = $\left[\frac{(D + E)}{2} + 28 \text{ in.}\right] \times 3$ = 164.1 in. (13.675') (24 + 29.4 = 53.4 → 26.7 → 54.7)

Upslope setback (J) = (22 in. + D) × 3 × upslope corr. factor = 120.75 in. (10.0625') (22 in. + D = 46; 138; 0.875)

Downslope setback (I) = (22 in. + E) × 3 × downslope corr. factor = 181.956 in. (15.163') (22 in. + E = 51.4; 154.2; 1.18)

Total Width of Mound (W) = 12A + J + I = 410.706 in. (34.226') or 34' 3" OK (12A = 108)

Total Length of Mound (L) = 12B + K + K = 69.35 Ft. (or 69' 4" OK) (12B = 42; K + K = 27.35')

Mound Area 2373.6 ft²

RE: Sand Mound Design
John M. Jefferson Property
18653 Penn Shop Road
Mt. Airy, Maryland 21771

Dear Mr. Clise:

This office has reviewed the design plans and specifications for a sand mound sewage disposal system to service the above referenced property. I am pleased to inform you that these plans are approved as submitted.

However, there are several minor changes suggested for the final copy of these plans as noted below:

1. On the specification sheet, page 1, order design criteria - correct mound area to read (34' - 2" x 69' - 4").

2 You may delete the detail for OP#4 as there is no perched water table at this site. If the deletion is used, place OP#3 at OP#4's site on the mound layout detail.

3. Reorient the repair mound (nearest TPB) so that it's long axis will be perpendicular to the one shown, for a suggested better orientation to the prevailing contours. (Copy of proposed change enclosed.)

If you have any question, please call me at 313-2640, Monday through Friday, 8:30 a.m. - 5:00 p.m.

Above requested changes were in final plan received 6/24/93 RJP

Very truly yours,

RE: Percolation Testing
Penn Shop Road
Tax Map: 6 Parcel: 16"A"

Dear Mr. and Mrs. Jefferson:

A percolation test date has been reserved for 10:00 a.m., Wednesday, August 19, 1992.

You will be responsible for having a contractor on-site to excavate test holes at the corners of proposed percolation area.

The proposal is to subdivide a single lot from a larger property containing two existing houses. No health department records could be located regarding the location or condition of the existing well and septic system.

Part of the subdivision review process is to ensure that any remainder existing parcel has adequate provision for its water supply and waste disposal requirements.

To this end, percolation testing should be conducted to confirm that the condition of the existing septic system is satisfactory. For an existing house, a $25.00 septic repair permit fee can be assessed instead of the standard $225.00 percolation test fee. The well would also be subject to construction inspection to ensure that it is properly protected.

Please call to confirm test date and to discuss testing requirements for existing house.

Thank you for your cooperation in this matter.

Very truly yours,

Craig Williams, DEN
